

**TERWILLIGER ALGEBRAS BEYOND  
DISTANCE-REGULAR GRAPHS: A COMBINATORIAL  
APPROACH**

Blas Fernández

The Terwilliger algebra  $T$  has been extensively studied in the context of distance-regular graphs, which have only a few irreducible  $T$ -modules (up to isomorphism) of a specific endpoint, all of which are thin (with respect to a certain base vertex).

This talk aims to extend these results to irreducible  $T$ -modules with endpoint 0 of certain (not necessarily distance-regular) graphs, and shed some new light on their combinatorial properties.

Let  $\Gamma$  be a finite, simple, and connected graph. We examine which vertices  $x$  of  $\Gamma$  admit a Terwilliger algebra  $T = T(x)$  with an irreducible  $T$ -module with endpoint 0, which is thin. We give a purely combinatorial characterization to this algebraic property, which involves the number of certain walks in  $\Gamma$  of a specific shape.
